Professional Summary

Backend Engineer with extensive Golang expertise in developing high-performance, scalable systems. Successfully reduced downtime by 30% through optimized, event-driven architectures and robust API integrations. Skilled in deploying cloud-native microservices and enhancing system reliability in agile environments. Ready to leverage technical proficiency and collaborative experience to deliver innovative backend solutions.

Education

Lincoln University Malaysia

Bachelor's Degree, Computer Science

2024

Aptech Computer Education India

Advanced Diploma, Software Engineering

2023

Work Experience

Cofikra

Dec 2025

FullStack Developer

Abuja, Federal Capital Territory, Nigeria

- I engineered a full-stack e-commerce platform using **Vue 3 (Composition API)** for the frontend and **Golang** for backend services. I designed RESTful APIs, implemented authentication and authorization flows, and built key modules such as product catalog management, order processing, and user account management. On the frontend, I developed responsive and interactive interfaces, optimized state management, and ensured seamless communication with backend services. I also focused on performance optimization, clean architecture, and maintainable code to support scalability as the application grew.

Zolvat

May 2025

Golang Developer

Cyprus

At Zolvat, a fintech startup, I worked as a Full Stack Engineer specializing in compliance and risk management systems. I developed a comprehensive transaction monitoring platform using Go for the backend API and Vue.js for the frontend interface. My key achievements included designing and implementing a sophisticated rule engine that evaluates 70+ compliance rules for international money transfers, including FATF sanctions screening, geographic risk assessment, and suspicious activity detection. I created automated testing frameworks using Postman collections and shell scripts to validate all compliance rules, ensuring the system properly identifies high-risk transactions (Iran, North Korea) with 3000-4000 risk scores, medium-risk scenarios (Nigeria, Serbia) with 200-1400 scores, and suspicious activities (fraud, money laundering) with 1001 scores. The system processes real-time transfer data, applies risk scoring algorithms, and provides appropriate actions (Reject Transaction, Flag for Compliance Review, or No Action) based on regulatory requirements. I also implemented enhanced logging systems and database optimizations to improve rule evaluation performance and maintain audit trails for compliance reporting.

ghogl

Jan 2025 - 2025

Software Developer / IT support

Port-Harcourt, Rivers State, Nigeria

Engineered and maintained robust serverless backend systems using Golang Lambda functions and AWS CDK for infrastructure-as-code, supporting real-time data flow for offshore and onshore operations. Deployed cloud-native microservices with DynamoDB for scalable data storage that enhanced operational visibility and safety compliance across multiple facilities. Automated infrastructure provisioning with AWS CDK and improved data pipeline reliability via Lambda event-driven architecture, enabling faster field incident responses and reducing downtime by 30%.

- Developed scalable internal web applications for equipment monitoring, maintenance scheduling, and environmental compliance tracking by integrating React frontends with Golang Lambda APIs and a DynamoDB backend. Streamlined workflows between engineering teams and compliance officers through efficient event-driven Lambda functions and serverless system integration. Created real-time dashboards leveraging DynamoDB Streams and Lambda triggers to visualize live sensor data from offshore rigs, empowering quicker decision-making.
- Collaborated with field engineers and HSE teams to design intuitive interfaces for safety inspections and incident reporting tools powered by serverless Golang Lambda functions. Enhanced user experience by refining DynamoDB query patterns and Lambda response times, thereby reducing training periods for new users. Launched responsive React applications via AWS CDK to ensure high availability and usability across diverse devices in field environments.

Sifon 360

May 2024 - 2024

Software Developer

Abuja, Federal Capital Territory, Nigeria

- Utilized AWS services to deploy and scale backend systems crafted with Go, reinforcing platform reliability for thousands of students across Nigeria. Managed API development and integrations using Go's native HTTP packages and the AWS SDK, and implemented secure cloud storage solutions for user data access related to housing and lifestyle resources.

- Constructed and maintained cross-platform applications leveraging Go for backend APIs and React for frontend interfaces, thereby improving accessibility and user experience. Developed core features including RESTful APIs for housing listings, concurrent booking systems using Go's sync primitives, and geospatial service discovery tools using Go's efficient JSON processing, which contributed to a 25% increase in customer satisfaction by achieving sub-100ms response times.
- Partnered with product teams to architect API endpoints and data flows for services spanning housing, religious centers, libraries, and sports facilities. Devised Go-based backend services supporting real-time data synchronization and caching strategies through Redis integration, and ensured robust JSON API error handling and logging using Go's standard library to bolster application reliability and developer efficiency.

Agit Solutions NG

Aug 2022 - 2022

Software Developer

Abuja, Federal Capital Territory, Nigeria

Developed secure, scalable backend systems using Spring Boot and PHP to support a variety of NGO operations across Abuja. Integrated Spring Security to enforce robust authentication and authorization protocols, reducing system vulnerabilities by 50%.

Applied backend performance tuning and API optimization techniques, enhancing system reliability for high-traffic NGO platforms.

- Built and maintained full-stack web applications using Java, PHP, and React, tailored to the unique workflows of non-profit organizations. Delivered custom software solutions for NGO case management, event coordination, and beneficiary tracking. Ensured consistent integration between front-end and server-side logic, enabling smooth user experiences across various services.
- Collaborated with front-end developers and designers to implement intuitive, accessible interfaces aligned with NGO user needs. Provided mentorship and technical guidance to junior developers, fostering a collaborative, growth-oriented development environment. Conducted training sessions and hands-on coding workshops for students, contributing to the team's professional development and knowledge sharing.

Projects

Docexpiry

2025

ghogl

- A serverless document management solution that automatically tracks expiration dates using Golang, AWS CDK, and Google APIs to provide timely notifications and a real-time dashboard.

Idahvis.ng

2024

web solutions

- IDAHVIS NIGERIA LIMITED is a multidisciplinary consulting company specializing in Project Management, Construction Consultancy, Information Technology services, and General Contracts.

Heartystyles

2025

web solutions

- HeartyStyles is a Nigerian-based fashion brand specializing in bespoke and ready-to-wear men's clothing. The brand is renowned for its commitment to quality craftsmanship and contemporary designs, catering to a diverse clientele seeking stylish and affordable fashion options.

Vaccy

2023

Innovative Apps

- Vaccy is a Nigerian-based health platform designed to empower users with tools to manage their health proactively. The platform offers features such as vaccine tracking, medication reminders, doctor consultations, health blogs, USSD integration, and access to a comprehensive hospital database.

IMDB clone(Django Rest Framework)

2021

Personal project

- This project is a backend API clone of the Internet Movie Database (IMDB), developed using Django REST Framework (DRF) and PostgreSQL. It offers endpoints for managing movies, reviews, and user interactions, incorporating robust authentication, filtering, and testing mechanisms.

Secure Me

2022

School project

- SecureMe is a web-based password generator designed to help users create strong, customizable passwords effortlessly. Built using Django, HTML, and CSS, the application offers a user-friendly interface for generating passwords based on selected criteria, enhancing online security practices.

Skills

- **Programming Languages:** Javascript, Python, Golang, Java
- **Web Technologies:** React, SpringBoot, Django, CSS, HTML, API Integration
- **Cloud Platforms:** AWS, Google Cloud Platform, Azure
- **Data Engineering:** Apache Kafka, Hadoop
- **Big Data Technologies:** HDFS
- **DevOps Tools:** Docker, Jenkins
- **Database Systems:** MySQL, MongoDB, PostgreSQL

- **Soft Skills:** Leadership, Communication, Problem Solving, Team Collaboration, Creativity
- **Development Practices:** TDD, CI/CD Pipelines, Agile Methodology, Automated Testing, SOLID Principles, Web Architecture Patterns

Certifications

- Postman Certified - Associate
- Meta Certified - Associate
- Amigoscode Certified - Associate

Awards & Recognition

- Face of IUB (Institute Universitaire du Benin) Computer Science

Volunteering & Leadership

Code for Good

Volunteer Software Developer

- Developed web applications for non-profit organizations, improving their digital presence and outreach.

Local Tech Meetup

Organizer

- Organized daily meetups and workshops to promote knowledge sharing and networking among local tech professionals.
